

Helen Berrington

Our persona is over 65 years old, and suffers from Alzheimer's Disease.

She lives at home by herself, so, she has to be on her own for long periods of time.

Caregivers and relatives help her achieve every day tasks.

She likes walking in the park, and going out with friends.

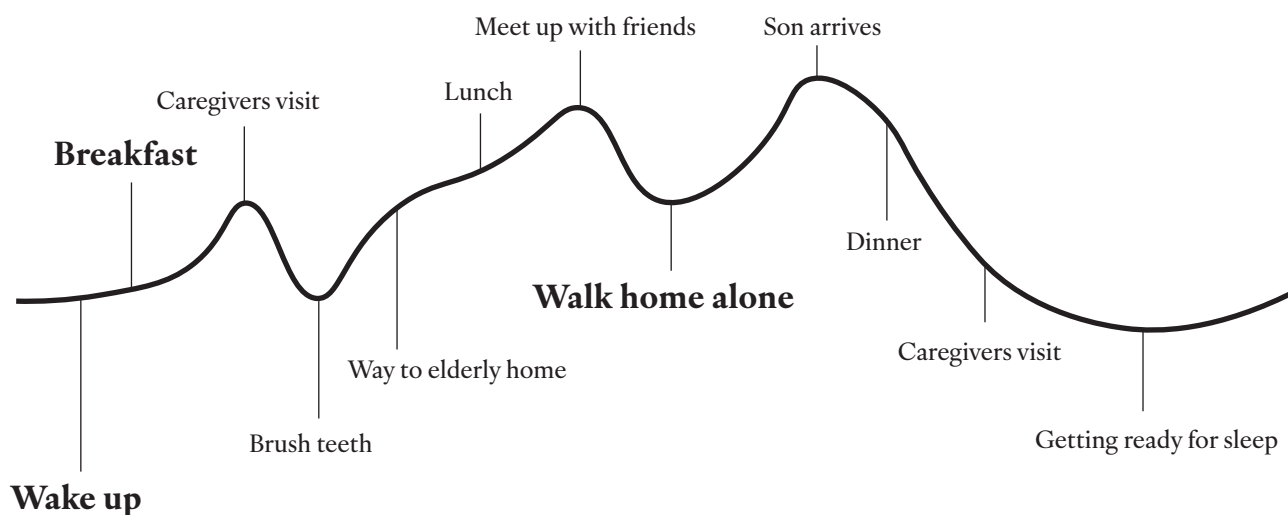

Overall Helen needs safety and observation.

But she also wants more independence, and does not want to feel tethered to tech or others.

Accessible and fast responses from relatives are important.

So that, if something happens, help is coming quickly.

She requires automatic features that do not overwhelm her. With simple and familiar design.

Above you can see our patient's daily routine. Over time our patient should feel safer, when being alone. This will help the patient spending better time doing the things she likes to do, while still having the feeling of independence.

The patients relatives are given easier access to the status of the patient's well-being. Which, after a short period of time, should make things easier for them, too.

Elevator Pitch

Bracelet or watch with core safety features. In case of an accident, the bracelet will recognize sudden movement, and through vibration and sound the user will be reminded of the bracelet. To prevent the user from getting lost, it will be trackable with GPS, and will have an NFC emergency pass.
